Academic Program and Course Description Guide

Academic Program Description Form

University Name: Tikrit University

Faculty/Institute: Petroleum Process Engineering

Scientific Department: Petroleum and Gas Refining Engineering

Academic or Professional Program Name: Undergraduate - Bachelor of Science in

Petroleum and Gas Refining Engineering

Final Certificate Name: Bachelor of Science in Petroleum and Gas Refining

Engineering

Academic System: Annual

Description Preparation Date: 6 /4 / 2025

File Completion Date: 20/4/2025

Signature:

Head of Department name:

Asst. Prof. Qahtan Adnan Mahmood

Date: 21/4/2025

Signature:

Scientific Associate name:

Asst. Prof. Omer Yasin Thayee

Date: 12/ 4 / 2025

The file is checked by:

Department of Quality Assurance and University Performance

Director of the Quality Assurance and University Performance Department:

Lect. Adnan Ibrahim Ahmed

Date: 21/4/2025

Signature:

Asst. Prof. Ghassan H. Abdullah

Date: 21/4/2025

Approval of the Dean

1. Program Vision
Improving the department's educational level using the most recent ways.
2. Program Mission
Providing community service by developing the Petroleum sector in the governorate and across the nation.
3. Program Objectives
 1- Providing students with the fundamentals of scientific knowledge in the field of Petroleum and gas refining engineering, as well as developing their professional skills in the areas of analytical and creative thinking through the use of information technologies, data analysis, and modern experimental methods in problem formulation and solution. 2- Preparing well-qualified engineers to enhance petroleum process engineering
operations and handle dealings with them in all aspects of life, particularly in the petroleum industry.
3- Conducting academic research to stay up with the world scientific process, as well as applied research to turn engineering knowledge and ideas into practical reality by solving the country's challenges in all domains.
4- Contributing to the country's reconstruction in the petroleum and petrochemical industries sectors by providing engineering consultations, preparing economic feasibility studies, project designs, and technical services.
5- Implementing scientific sobriety as a characteristic of this department in line with international rules and standards.
4. Program Accreditation
N. A.

5. Other external influences

(Only different state institutions provide summer internship for third-year students.)

6 Program Structure

Program Structure	Number of Courses	Credit hours	Percentage	Reviews•
Institution Requirements	7	18	11%	/
College Requirements	9	32	20%	/
College Requirements	22	112	69%	/
Summer internship	1	/	/	/
Others	/	/	/	/

^{*} This can include notes whether the course is basic or optional.

7. Program Description							
Year/Level	Course Code	Course Name	Credit Hours				
			theoretic al	practical			
Four years	BSc-PGR	Bachelor of Science in Petroleum and Gas Refining Engineering	176	56			

8. Expected learning outcomes of the program

Knowledge

- A1- Broad education to understand the impact of engineering solutions globally and economically.
- A2: The ability to collaborate in interdisciplinary teams.
- A3- The ability of applying cognitive sciences such as mathematics, as well as applied and pure sciences.
- A4- The ability to use modern methods, skills, and engineering tools in the petroleum and petrochemical sectors.
- A5- The ability to build petroleum and petrochemical facilities that satisfy the necessary requirements while remaining within realistic cost limits.
- A6- The ability to develop and perform experiments, analyze data, and translate them practically.

Skills

- B1- Developing and enhancing the student's ability to utilize design programs in their area of specialty.
- B2- Developing and improving the student's ability to cope with new technology relevant to the course terminology.
- B3- Improving the student's ability to face challenges and dilemmas and find acceptable answers to them.
- B4- Developing and improving the student's ability to apply academic knowledge in real-world situations.

Ethics

- C1- The ability to make decisions.
- C2- Student-driven innovation methods.
- C3: The student's ability to think.
- C4- Collecting the necessary data to complete a certain subject.
- C5. Encouraging students' creative thinking and keeping up with the most recent scientific approaches for teaching and learning.
- 9. Teaching and Learning Strategies

- 1. Introducing course syllabus to students (lectures).
- 2. Numerous examples are provided to demonstrate the basic principles.
- 3. A standardized problem-solving approach that can be applied to any problem.
- 4. Use figures, drawings, and graphs to offer extensive explanations and reinforce what the learner is reading.
- 5. At the conclusion of each chapter, self-assessment exams with answers are provided to measure learning progress.
- 6. Discussing and solving many problems in tutorial sessions, which enables collaboration with one or more colleagues to share ideas and debate the content.
- 7. Assigning activities, such as drafting research papers, to help students develop self-learning and presenting abilities.
- 8. Conducting quizzes.
- 9. Taking semester and final examinations on the designated dates.
- 10. Informing students about how grades are calculated for students during the semester and their exam results, and discussing failures and successes.
- 11. Informing students of the textbooks and reference books they need in the course and make a questionnaire for previous years in order to improve the curriculum, improve the performance of teaching staff, and raise the scientific level of the student.
- 12. Training students in various state institutions (third stage).
- 10. Evaluation methods
- 1. Monthly and final exams.
- Short assessment and classroom involvement.
- 3. Submitting homework, research papers, and scientific reports.
- 4. Laboratory work.

11. Faculty

Faculty Members

Academic Rank	Specialization		Special Requirements/Skills (if applicable)		Number of the teaching staff		
	Gener al	Special			Staff	Lecturer	
Professor	1	2			1	2	
Assistant Professor	1	5			6	-	
Lecturer	-	10			8	2	
Assistant Lecturer	4	4			8	-	

Professional Development

Mentoring new faculty members

Preparation programs in the form of open lectures and seminars with training workshops that include:

- 1. Introducing new faculty members to the university's vision, mission, organizational structure, policies and procedures.
- 2. Enabling new faculty members to obtain a better understanding of their rights and obligations in addition to the rights and duties of students.
- 3. Providing new faculty members with detailed information about the facilities and services of the university, college, and department.
- 4. Introducing new faculty members to the quality of the academic program and program accreditation.
- 5. Introducing new faculty members to learning resources and scientific research programs.

Professional development of faculty members

- 1. Using current teaching methods and techniques.
- 2. Sharing experiences with academics from various institutions and universities.
- 3. Help evaluate, construct, and analyze the curriculum.
- 4. Continuous course assessment based on comments from instructors and students.
- 5. Be open to new experiences.

12. Acceptance Criterion

- 1. High school graduates (applied branch).
- 2. Admission is open to both male and female.
- 3. The Central Admissions Department of the Ministry of Higher Education and Scientific Research determines the minimal acceptance grades.
- 4. The desire of the student or guardian to study in the department.
- 13. The most important sources of information about the program
- 1. textbooks.
- 2. The teaching staff.
- 3. Workshops, seminars and conferences.
- 4. Websites and electronic library.
- 5. The local market and its needs.
- 14. Program Development Plan
- 1. Continuously updating the curriculum to keep pace with the curricula of international and established universities and the needs of the local market.
- 2. Increase interest in the practical aspect by providing modern educational laboratory equipment and opening new laboratories.
- 3. Providing modern textbooks and reference books from international publisher to the department's library.
- 4. Incorporating scientific and technological developments at the global level into school curricula and practical experiences.
- 5. Design and implement development programs in the form of open lectures and seminars with training workshops for teaching and professional staff.
- 6. Make memorandums of understanding with state institutions in the field of exchanging experiences and conducting scientific research and studies.

Relation with other Modules						
Prerequisite module	None	Semester				
Co-requisites module	None	Semester				

Module Aims, Learning Outcomes, and Indicative Contents							
	1. Introduction to petrochemical engineering.						
	2. Chemicals from direct conversion of methane.						
	3. Production of methanol & methanol to olefins MTO process.						
	4. Methanol to Gasoline MTG process.						
Module Objectives	5. Mobil olefin to gasoline & distillate (MOGD) process.						
	6. Production of iso-octane						
	7. GTL process.						
	8. Production of benzene and xylene						
	9. Production of linear alkyl-benzene						
	10. Production of linear alkyl-benzene sulphonic acid						
	1. Knowing the fundamentals of petrochemical industry and petrochemical feedstock.						
	2. Knowing the fundamentals syngas process and chemicals from syngas.						
	3. Knowing the fundamentals of syngas to methanol process and production of olefins.						
Module	4. Knowing the fundamentals of methanol to gasoline process						
Learning Outcomes	5. Knowing the fundamentals of ethylene process.						
	6. Knowing the fundamentals of HF alkylation process of C4= and iC4 to produce iC8						
	7. Knowing the fundamentals of Fischer Tropsch technology.						
	8. Knowing the fundamentals of BTX production from LPG.						
	9. Knowing the fundamentals of linear alky benzene production.						
	Part A: Introduction to petrochemical engineering and petrochemical feedstock [4 hr.], Part						
Indicative Contents	B: The fundamentals of Syngas technology [20 hr.], Part C: GTL processes [8 hr.], Part D:						
	Chemicals based on benzene [12 hr.], Part E: Production of LAB and LABS [12 hr.]						

	Learning and Teaching Strategies					
	The main strategy that will be adopted in delivering this module is to motivate					
	students' participation in the class by raising questions and inquiries while at the					
Strategies	same time refining and expanding their critical thinking skills. This will be achieved					
	through classes, interactive tutorials, symposiums that are interesting to the					
	students, and self-assessment tests.

Prerequisite module	PGR111	Semester	One					
Co-requisites module	None	Semester	-					
Modu	e Aims, Learning Outcomes and Indicat المادة الدراسية ونتائج التعلم والمحتويات الإرشادية							
Module Aims أهداف المادة الدر اسية	 To provide a detailed study of the main chemical separation units. To enable students to select the appropriate technology for chemical separation processes based on correct criteria. To study the design calculations for the equilibrium stages of various chemical separation processes, including diffusion, absorption, and distillation. To familiarize students with mass transfer calculations. To provide a deep understanding of the design calculations for absorption and distillation units. To develop the ability to diagnose and analyze various chemical separation processes within industrial facilities, with a specific focus on oil and gas plants. 							
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Upon successful completion of this module, students will be able to: Explain and analyze gaseous and liquid diffusion processes. Derive the laws that govern mass transfer processes. Analyze and design gas absorption processes, including the selection of an appropriate solvent and the application of all relevant design equations and derivations. Design packed absorption towers. Analyze and perform design calculations for binary distillation processes, including the derivation of all fundamental design equations. Design distillation towers. 							
Indicative Contents	Part A: Diffusion (16 hrs.)							

المحتويات الإر شادية

- Study of the diffusion process, including Fick's Law and its governing equations.
- Exploration of gaseous diffusion processes and their associated equations.
- Analysis of the diffusion coefficient, its determination, and related rates.
- Distinction between diffusion processes in gases and liquids.

Part B: Absorption (20 hrs.)

- Learning about two-film theory and its fundamental equations and derivations.
- Study of gaseous absorption processes and their related equations.
- Introduction to the design methods for gas absorption columns.
- Analysis of tray columns and their design equations.
- Identification of wetted-wall columns and columns involving chemical reactions.
- Understanding of stripping columns.

Part C: Distillation (20 hrs.)

- Study of distillation processes and the concept of equilibrium state.
- Analysis of fractional distillation columns for binary systems.
- Calculations for determining the number of stages in distillation columns.
- Understanding the q-line equation and its use in calculations.
- Learning how to perform calculations for multi-feed and sidestream systems.

Learning and Teaching Strategies

استراتيجيات التعلم والتعليم

Strategies

Students will be actively engaged in tasks designed to help them develop and hone their critical thinking abilities. This will be achieved through a combination of lectures, interactive tutorials, and assignments that include engaging and challenging tasks.

The course will incorporate the following strategies to facilitate learning:

• Detailed Examples: Numerous examples will be worked through in

detail to illustrate the fundamental principles.

- Consistent Problem-Solving Strategy: A consistent strategy for problem-solving will be taught, which can be applied to a wide range of problems.
- Visual Reinforcement: Figures, sketches, and diagrams will be used to provide a detailed description and reinforce the concepts being taught.
- Self-Assessment: Self-assessment tests with answers will be provided at the end of each section to allow students to evaluate their progress.
- Collaborative Learning: Many problems will be discussed and solved during tutorial classes, providing opportunities for students to work with classmates to exchange ideas and discuss the material.

	Part C - Storage and Transport of NG (6 h)			
	Pipelines and pumping of crude oil (3 h), and oil spill-treating agents (3 h)			
Learning and Teaching Strategies				

استراتيجيات التعلم والتعليم

The main strategy that will be adopted in delivering this module is to encourage students' participation in the exercises, while

at the same time refining and expanding their critical thinking skills. This

will be achieved through classes and interactive tutorials. The following steps will be applied to enhance the learning strategies:

Strategies

- 1. Using appropriate teaching methods in line with the level of students and allowing students to discuss.
- 2. Using modern and advanced means to deliver the largest amount of knowledge to the student.
- 3. Presenting the course vocabulary to the students (lectures).
- 4. Assigning students assignments, such as writing research papers, so that students acquire skills for self-learning and presentation.
- 5. Conducting sudden exams.
- 6. Oral exams via e-learning platforms.
- 7. Conducting the quarterly and final exams on the specified dates.
- 8. Informing students of how students' grades are calculated during the semester, their exam results, and discussing failures and successes.
- 9. Informing students of the curriculum books and auxiliary books that they need in the course vocabulary

Mod	dule Aims, Learning Outcomes and Indicative Contents
10100	أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية
Module Objectives أهداف المادة الدراسية	The major aim of this course is to give the student the required knowledge for design and operation of chemical reactors including single and multiple-reactors system. it will cover concepts ranging from basics such as the kinetics of homogeneous reactions, rate equation, searching for a mechanism, to the reactor design including batch reactor, mixed flow reactors, plug flow reactors, and other design parameters like size comparison of single reactors, pressure drop in packed bed reactor.
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Identify the principles of chemical engineering, including material balance with chemical reaction and chemical reaction equilibrium. Able to design a chemical reactor that need it in petroleum refinery. Ability to deal with rate equation. Ability to deal with all reactor types and their design for single or multiple. Ability to deal with reactions (reversible, irreversible, series, parallel, etc.). The skills goals special to the course. This course will provide students with sufficient understanding to convert the informat obtained by laboratory into information useful in designing chemical reactors, which w make the most of them in the next phase of designing the reactors for the engineering project and thus provide a graduate who is able to design reactors. C. Affective and value goals At the end of the course presented, the student will possess all the necessary skills to dwith problems in designing or operating reactors.
Indicative Contents المحتويات الإرشادية	Indicative content includes the following: 1. Kinetics of Homogeneous Reactions: Concentration dependent term of a rate equation in single and multiple reactions, elementary and nonelementary reactions, molecularity and order of reaction, rate constant k, testing kinetic models, temperature dependency from Arrhenius' Law, Activation energy and temperature dependency. [8 hrs] Predictability of reaction rate from theory. Concentration-Dependent Term, Temperature-Dependent Term, Use of Predicted Values in Design. [2 hrs] 2. Interpretation of batch reactor data: Constant-volume batch reactor, analysis of total pressure data obtained in a constant-volume system, the conversion, integral method of analysis of data, irreversible unimolecular-type first-order reactions, irreversible bimolecular-type second-order reactions, empirical rate equations of nth order, zero-order reactions, overall order of irreversible reactions from the half-life t _{1/2} , Irreversible reactions in parallel, Varying- volume batch reactor, nth -order and other reactions. for all rate forms other than zero-, first-, and second-order the integral method of analysis. [12hrs]

- 3. Temperature and reaction rate, the search for a rate equation, Calculation of k from Individual data points, calculation of k from pairs of data points, graphical method of fitting data. [4 hrs] 4. Introduction to reactor design, general discussion, symbols and relationship between CA and XA, constant density batch and flow systems, batch and flow systems of gases of changing density but with T and π constant, batch and flow systems for gases in general (varying p, T,π). [4 hrs] 5. Ideal reactors for a single reaction: Ideal batch reactor, space-time and spacevelocity, steady-state mixed flow, steady-state plug flow reactor, holding time and space time for flow reactors. [8 hrs] 6. Design for single reactions: Size comparison of single reactors (batch reactor, mixed versus plug flow reactors, first- and second-order reactions, variation of reactant ratio for second-order reactions, general graphical comparison [2 hrs]. 7. Multiple-reactor systems: Plug flow reactors in series and/or in parallel, equal-size mixed flow reactors in series, mixed flow reactors of different sizes in series, finding the conversion in a given system, determining the best system for a given conversion, reactors of different types in series, recycle reactor, autocatalytic reactions, plug flow versus mixed flow reactor, no recycle, optimum recycle operations, reactor combinations, [12 hrs].
 - 8. Design for parallel reactions: Introduction to multiple reactions, the selectivity, the side entry reactor [2 hrs].
 - 9. Potpourri of multiple reactions: irreversible first-order reactions in series, first-order followed by zero-order reaction, zero-order followed by first-order reaction, successive irreversible reactions of different orders, reversible reactions, irreversible series-parallel reactions, two- step irreversible series-parallel reactions, the Denbigh reactions and their special cases. [4 hrs]
 - 10. Temperature and pressure effects: Single reactions, heats of reaction from thermodynamics, exothermic reactions in mixed flow reactors-a special problem, adiabatic plug flow reactor performance.
 - 11. Pressure drop in packed bed reactor, pseudo order reactions [4 hrs]

Learning and Teaching Strategies

استراتيجيات التعلم والتعليم

Strategies

This document provides the academic description of the reactor design course, which includes introducing the skills of the third stage students in the department of petroleum refinery engineering to understand what chemical reactions are from an engineering point of view. This course will provide students with sufficient understanding to convert the information obtained by laboratory into information useful in designing chemical reactors, which will make the most of them in the next phase of designing the reactors for the engineering project and thus provide a

graduate who is able to design reactors.

Module A	ims, Learning Outcomes, Indicative Con	tents and Bri	ef			
	Description					
تصر	الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مخ	أهداف المادة				
Module Aims أهداف المادة الدراسية	This course provides a comprehensive introduction to heat transfer fundamentals and their applications. The course introduces students to the analysis of steady-state and transient one-multi dimensional heat conduction.					
Module Learning Outcomes	On completion of this course students will be able to: Heat Conduction Equation (Heat Diffusion Equation)					
مخرجات التعلم للمادة الدر اسية	 Apply Fourier's law to calculate heat transfer rates in Cartesian, cylindrical, and spherical coordinates. Analyze steady-state conduction through composite walls, cylindrical bodies, and spherical bodies. 					

3. **Evaluate** heat transfer performance in a double-pipe heat exchanger by integrating conduction and convection principles. 4. Calculate heat transfer through extended surfaces (fins) and assess fin efficiency and effectiveness. 5. **Solve** problems involving unsteady (transient) heat conduction in solids. 6. **Apply** lumped system analysis to predict temperature variation in small bodies with negligible internal resistance. **Principles of Convection** 7. **Explain** the role of viscous flow in convective heat transfer. 8. **Describe** the formation of laminar boundary layers on flat plates. 9. **Interpret** the temperature profile within the thermal boundary layer and its effect on the heat transfer coefficient. 10. **Analyze** heat transfer in turbulent flow through tubes using empirical correlations. 11. **Evaluate** laminar heat transfer in tubes using analytical and empirical solutions. Introduction to Modes of Heat Transfer: conduction, convection, and an overview of applications. **Heat Conduction Equation (Heat Diffusion Equation)** Fourier's law of heat conduction in Cartesian, cylindrical, and spherical coordinates. One-dimensional steady-state conduction through a composite wall. Radial conduction through cylindrical bodies. Radial conduction through spherical bodies. Heat transfer in double-pipe heat exchangers. **Indicative** Heat transfer through extended surfaces (fins): fin efficiency and Contents effectiveness. المحتويات الإرشادية Unsteady (transient) conduction in solids. Lumped system analysis for small bodies. **Principles of Convection** Fundamentals of viscous flow and its role in convection. Development of the laminar boundary layer on a flat plate. Temperature profile within the thermal boundary layer. Heat transfer in turbulent tube flow. Heat transfer in laminar tube flow. This course introduces the fundamental mechanisms of heat transfer with emphasis on conduction and convection. It covers the derivation and application of the heat conduction (diffusion) equation in Cartesian, cylindrical, and spherical coordinates, including steady-state and transient Course conduction in solids, conduction through composite walls, cylindrical and **Description** spherical bodies, as well as the use of extended surfaces (fins) to enhance heat transfer. The course also examines heat transfer in practical systems such as double-pipe heat exchangers. Principles of convection are explored through the study of viscous flow, the development of laminar and thermal

boundary layers, and heat transfer correlations for both laminar and
turbulent flows in tubes. The theoretical foundations are integrated with
engineering applications to develop students' ability to analyze, model, and
solve real-world heat transfer problems.

Learning and Teaching Strategies استراتيجيات التعلم والتعليم

Strategies

In this course, key concepts and methods are explained step by step in lectures, with plenty of examples to make ideas clear and practical. Students also get dedicated time to practice what they learn by working through a wide selection of guided tutorial problems.

	Delivery Plan (Weekly Syllabus) المنهاج الاسبوعي النظري						
	Material Covered						
Week 1	Find the roots of equations (fixed point method, Newton-Raphson method, bisection method, secant method)						
Week 2	Find the roots of equations (fixed point method, Newton-Raphson method, bisection method, secant method)						
Week 3	Solution of set of linear equations by (Jacobi method, Gauss-siedel method)						
Week 4	nonlinear set of equation (solve by Simple iteration or Gauss –seidel, Newton – Raphson method).						
Week 5	Numerical solution of ordinary differential equation (1 st order &2 nd order, solve by Tayler series, Runge kutaa).						

Week 6	Numerical solution of ordinary differential equation (1 st order &2 nd order, solve by Tayler series, Runge kutaa).
Week 7	interpolation (General Form of Newton's Interpolating Polynomials, Newton's Divided-Difference Interpolating Polynomials).
Week 8	Newton's Divided-Difference Interpolating Polynomials (Non linear, Linear, solve by D operator).
Week 9	Curve fitting (group average, least squar)
Week 10	Curve fitting (group average, least squar)
Week 11	Optimization Techniques (Optimization Terminologies: Objective Function, Decision Variable, Constraint).
Week 12	Mathematical Modelling of Optimization Problem (Linear Programing, nonlinear Programing).
Week 13	Multivariable Optimization with Inequality Constraints Optimization Techniques Introduction Numerical Optimization Techniques (Elimination Methods, Fibonacci method, Golden section method, Interpolation Methods, Newton Method).
Week 14	Multivariable Optimization with Inequality Constraints Optimization Techniques Introduction Numerical Optimization Techniques (Elimination Methods, Fibonacci method, Golden section method, Interpolation Methods, Newton Method).
Week 15	Preparatory Week
Week 16	Final Exam

	Delivery Plan (Weekly Lab. Syllabus) المنهاج الاسبوعي للمختبر					
	Material Covered					
Week 1	Find the roots of equations by Excel and Matlab					
Week 2	Solution of set of linear equations by Excel and Matlab					
Week 3	Numerical solution of ordinary differential equation by Excel and Matlab					
Week 4	interpolation by Excel and Matlab					
Week 5	Curve fitting by Excel and Matlab					
Week 6	Find maximum and minimum of Linear Programing by Excel and Matlab					
Week 7	Find maximum and minimum of Linear Programing by Excel and Matlab

Co-requisites module	None	Semester		

Module Aims, Learning Outcomes, and Indicative Contents				
	11. Introduction to petrochemical engineering.			
	12. Chemicals from direct conversion of methane.			
	13. Production of methanol & methanol to olefins MTO process.			
	14. Methanol to Gasoline MTG process.			
	15. Mobil olefin to gasoline & distillate (MOGD) process.			
Advid to Object out	16. Production of iso-octane			
Module Objectives	17. GTL process.			
	18. Production of urea			
	19. Production of benzene and xylene 20. Production of linear alkyl-benzene			
	21. Production of linear alkyl-benzene sulphonic acid			
	22. Production of HDPE and LDPE			
	23. Production of PVC			
	24. Production of polystyrene and DVPS			
	10. Knowing the fundamentals of petrochemical industry and petrochemical feedstock.			
	11. Knowing the fundamentals syngas process and chemicals from syngas.			
	12. Knowing the fundamentals of syngas to methanol process and production of olefins.			
	13. Knowing the fundamentals of methanol to gasoline process			
	14. Knowing the fundamentals of olefins oligomerization process to gasoline and distillates.			
24.11.	15. Knowing the fundamentals of HF alkylation process of C4= and iC4 to produce iC8			
Module	16. Knowing the fundamentals of Fischer Tropsch technology.			
Learning Outcomes	17. Knowing the fundamentals of ammonia and nitrogenic fertilizers process .			
	18. Knowing the fundamentals of thermal hydrodealkylation process THDA.			
	19. Knowing the fundamentals of PACOL & HF detergent Processes.			
	20. Knowing the fundamentals of sulphonation process.			
	21. Knowing the fundamentals of HDPL & LDPE manufacturing.			
	22. Knowing the fundamentals of PVC manufacturing.			
	23. Knowing the fundamentals of ion-exchangers manufacturing.			
	Part A: Introduction to petrochemical engineering and petrochemical feedstock [4 hr.], Part			
Indication Control	B: The fundamentals of Syngas technology [20 hr.], Part C: GTL processes [8 hr.], Part D:			
Indicative Contents	Chemicals based on benzene [12 hr.], Part E: Polymer engineering and manufacturing of			
	HDPE, LDPE, PS, and DVPS [12 hr.]			

Learning and Teaching Strategies				
	The main strategy that will be adopted in delivering this module is to motivate			
	students' participation in the class by raising questions and inquiries while at the			
Strategies	same time refining and expanding their critical thinking skills. This will be achieved			
	through classes, interactive tutorials, symposiums that are interesting to the			
	students, and self-assessment tests.			

Student Workload (SWL)

Relation With Other Modules العلاقة مع المواد الدراسية الأخرى								
Prerequisite module	None Semester							
Co-requisites module	None	None Semester						
Modu	Module Aims, Learning Outcomes and Indicative Contents أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية							
Module Aims أهداف المادة الدر اسية	 21. A detailed study of the main chemical separation units. 22. Using the correct criteria to select the appropriate technology for chemical separation processes. 23. Studying the design calculations for the equilibrium stages of chemical separation processes (, , distillation, extraction, evaporation and humidification). 24. Familiarity with material transfer calculations. 25. Familiarity with the design calculations of extraction. 26. Diagnosis and analysis of various chemical separation processes in industrial facilities, especially oil ones. 							
Module Learning Outcomes مخرجات التعلم للمادة الدر اسية	 Studying the processes of enthalpy- composition diagram (H_X diagram) and multi-compound distillation with the derivation of all the basic design equations. Studying solvent extraction processes using an appropriate solvent and the conditions for using it with all design equations. Studying the evaporation processes for the concentration of aqueous solutions and the derivation of the basic equations for the balance of matter and energy. Studying air humidification and cooling towers and design calculations of cooling tower. 							
Indicative Contents المحتويات الإرشادية	<u>Part A:</u> Distillation Learn about enthalpy Learn about multi-component distillation its calculations. (16 hr.)							

<u>Part B:</u> Extraction. - Learn about solvent extraction and equilibrium equations. - Recognize the number of stages of a complete immiscible solvent. - Recognize the partial separation using triangle curves and methods of their calculations. - Learn about solvent extraction devices and how they work. (20 hr.)

<u>Part C:</u> Evaporation. - Identify the methods of evaporation and the differences between them and the equations used in their calculation. - Learn about counter-directional evaporation and the equations used in its calculations. - Learn about co-current directional evaporation and the equations used in its calculations. (12 hr.).

<u>Part D:</u> Humidification. - Identify humidity and relative humidity in the case of constant temperature. - Understand the processes of hydration, phase balance, graphics and equations. - Equation and calculation of cooling tower design. (12 hr.).

Learning and Teaching Strategies

استراتيجيات التعلم والتعليم

The students will be actively engaged in the tasks, which will help them develop and hone their critical thinking abilities. This will be accomplished. Via lectures, interactive tutorials, and assignments incorporating fascinating tasks. The course includes:

- **Strategies**
- principles.

 2- A consistent strategy for problem solving that can be applied to any

1- Numerous examples worked out in detail to illustrate the basic

- 2- A consistent strategy for problem solving that can be applied to any problem.
- 3- Figures, sketches, and diagrams to provide a detailed description and reinforcement of what you read.
- 4- Self-Assessment Tests at the end of each section, with answers so that you can evaluate your progress in learning.

5- Many problems will be discussed and solved in the tutorial classes, which offer working with one or more classmates to exchange ideas and discuss the material.

Module Aims, Learning Outcomes and Indicative Contents						
أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية						
Module Objectives أهداف المادة الدراسية	Coope of Changing Donoity but with Tond - Constant Autopatalytic reaction					
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Identify the principles of Reactor Design, including the reaction with the chemical reaction equilibrium. Ability to deal with rate equation. Ability to deal with all reactions types and their design for single or multiple. Ability to deal with reactions (reversible, irreversible, series, parallel, etc.). The skills goals special to the course. This course will provide students with sufficient understanding to convert the information obtained by laboratory into information useful in designing chemical reactors with catalyst that use it in chemical reaction, which will make the most of them in the next phase of designing the reactors for the engineering project and thus provide a graduate who is able to design reactors. Affective and value goals At the end of the course presented, the student will possess all the necessary skills to deal with problems in catalyst. 					
Indicative Contents المحتويات الإرشادية	 Heterogeneous Reactions, the Complications of the Rate Equation, contacting patterns for two-phase systems, final thoughts on flow modeling. [12 hrs] Introduction to Reactor Design: General discussion, Symbols and Relationship between CA and X, Special Case 1. Constant Density Batch and Flow Systems, Special Case 2. Batch and Flow Systems of Gases of Changing Density but with T and. π Constant [12 hrs]. Autocatalytic reactions, recycle reactor, [8 hrs]. Temperature and Pressure Effects: Single reactions, Heats of Reaction from Thermodynamics, [12 hrs] Steady-State Mixed Flow Reactors, Steady-State Plug Flow Reactors [8 hrs]. 					

Learning and Teaching Strategies					
استراتيجيات التعلم والتعليم					
Strategies	Presenting the course vocabulary to the students (lectures). 2. Assigning students assignments, such as writing research papers, so that students acquire skills for self-learning and presentation. 3. Conducting sudden exams. 4. Oral exams via e-learning platforms. 5. Conducting the semester and final exams on the specified dates.				

- 6. Informing students of how students' grades are calculated during the semester, their exam results, and discussing failures and successes.
- 7. Informing students of the curriculum books and auxiliary books that they need in the course vocabulary during a questionnaire for the previous years to improve the curriculum, improve the performance of the teachers, and raise the level of the student.

Delivery Plan (Weekly Syllabus)

المنهاج الاسبوعي النظري

	Material Covered
Week 1	Heterogeneous Reactions, the Complications of the Rate Equation
Week 2	Contacting patterns for two-phase systems
Week 3	Final thoughts on flow modeling
Week 4	Introduction to Reactor Design: General discussion,
Week 5	Symbols and Relationship between CA and X: Special Case 1. Constant Density Batch and Flow Systems.
Week 6	Special Case 2. Batch and Flow Systems of Gases of Changing Density but with T and . π Constant
Week 7	Autocatalytic reactions
Week 8	Recycle reactor
Week 9	Mid-term Exam + The Denbigh reactions and their special cases
Week 10	The Denbigh reactions and their special cases
Week 11	Temperature and Pressure Effects: Single reactions
Week 12	Heats of Reaction from Thermodynamics
Week 13	Heats of Reaction from Thermodynamics
Week 14	Steady-State Mixed Flow Reactors
Week 15	Steady-State Plug Flow Reactors
Week 16	Preparatory week before the final Exam

	Description						
أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر							
Module Aims أهداف المادة الدراسية	This course provides a comprehensive introduction to heat transfer fundamentals and their applications. The course introduces students to the analysis of steady-state and transient one-multi dimensional heat conduction.						
Module Learning Outcomes مخرجات التعلم للمادة	On completion of this course students will be able to: 1. Understand a thermal system, develop the schematic diagram for the system, and apply energy balance and heat transfer models to develop governing equations. 2. Set up and solve for heat transfer rates as a function of geometry and materials in 1-D conduction using various tools: i.Material properties ii. Fourier's Law iii. Circuit Analogy						

3. Estimate heat transfer from Extended Surfaces, Radial Geometriand involving Energy Generation. 4. Construct a transient heat transfer analysis, testing for the lumper capacitance approximation, semi-infinite, infinite solids and understanding the assumptions. 5. Understand the approach for setting up numerical analysis for 2 conduction heat transfer. Indicative content includes the following. 1. Introduction to heat transfer (4hrs) 2. One-dimension steady state conduction without heat generation (4hrs) 3. One-dimension steady state conduction with heat generation (4hrs) 3. One-dimension steady state conduction with heat generation (4hrs)					
4. Construct a transient heat transfer analysis, testing for the lumper capacitance approximation, semi-infinite, infinite solids and understanding the assumptions. 5. Understand the approach for setting up numerical analysis for 2 conduction heat transfer. Indicative content includes the following. 1. Introduction to heat transfer (4hrs) 2. One-dimension steady state conduction without heat generation (4hrs)					
capacitance approximation, semi-infinite, infinite solids an understanding the assumptions. 5. Understand the approach for setting up numerical analysis for 2 conduction heat transfer. Contents 3 (Inc. dimension steady state conduction with heat generation					
or one annionation beautiful to the first					
المحتويات الإرشادية (4hrs)					
4. Heat transfer from extended surfaces (6hrs)					
5. Transient one-dimension conduction(6hrs)					
This is the first course in heat transfer, with an emphasis of					
understanding the fundamental physics underlying different heat transf					
Course processes, making proper approximations for analytical heat transf					
calculations and numerical methods for engineering heat transfer analys					
Description Topics include: introduction to three modes of heat transfer, therm					
resistance network analysis, steady-state conduction, transie					
conduction, analytical methods for heat conduction					
Learning and Teaching Strategies					
استراتيجيات التعلم والتعليم					
The learning and teaching strategy is designed to: Carefully cover					
lectures the necessary fundamental material and analytical technique					
Strategies and demonstrate concepts with appropriate (and where possible					
practical) examples Allow students adequate time to practice the					
techniques using a large number of carefully selected tutorial problems.

Module Aims, Learning Outcomes and Indicative Contents أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية								
Module Aims أهداف المادة الدر اسية	Introduce students to the fundamentals of statistics, correlation, regression, and experimental design. The course covers descriptive and inferential statistics, correlation and regression coefficients, identifying the fundamental concepts of designing and analyzing experiments, learning about the various hypothesis tests and their application, addressing the analysis of variance, introducing the various designs for designing of experiments, and the method of imitating data.							
Module Learning Outcomes مخرجات التعلم للمادة الدر اسية	 11. Learn the fundamentals and concepts of st 12. Understand the concepts of descriptive at well as their respective measures. 13. Collect data and perform central tend dispersion measurements. 14. Comprehend the correlation and regressions. 15. Understand the fundamentals of experimentals. 16. Learn about the hypothesis tests and their their concepts. 17. Learn one-way and two-way analysis of value analysis, including the completely randers. 	ency measuren on. ntal design and applications. ariance. implementation	analysis.					

randomized complete block design.							
	Indicative content includes the following:						
Indicative Contents المحتويات الإرشادية	 Introduction: Statistical data, classification and tabulation of data, frequency distribution tables, cumulative frequency tables (ascending and descending), and graphical representation of data and frequency distributions [6 hrs]. Measures of central tendency: Arithmetic, geometric, and harmonic means, median, upper and lower quartiles, mode, relation between means [6 hrs]. Measures of dispersion: Range, quartile deviation, mean deviation, standard deviation, coefficient of variations, symmetric distribution, skewness, oblation [6 hrs]. Correlation and regression: Coefficient of correlation, calculation of correlation factor, Spearman's order correlation factor, association coefficient, harmonic coefficient, regression, relation between correlation and regression coefficients [6 hrs]. Fundamental principles of counting: Permutation, arrangements, and combinations, binomial theorem [3 hrs]. Design of experiments: Introduction, terminology, statistical method [3 hrs]. Comparison between groups: Comparison between two population means with equal and unequal variances, comparison between two population variances [3 hrs]. Analysis of variance: One-way and two-way ANOVA [3 hrs]. Randomized design of experiments: Completely Randomized Design and Completely Randomized Block Design [6 hrs]. 						
	Learning and Teaching Strategies						
	استراتيجيات التعلم والتعليم The students will be actively engaged in the tasks, which will help them.						
Strategies	 The students will be actively engaged in the tasks, which will help them develop and hone their critical thinking abilities. This will be accomplished via lectures, interactive tutorials, and assignments incorporating fascinating tasks. The course includes: Numerous examples worked out in detail to illustrate the basic principles. A consistent strategy for problem solving that can be applied to any problem. Figures, sketches, and diagrams to provide a detailed description and reinforcement of what you read. Self-Assessment Tests at the end of each section, with answers so that you can evaluate your progress in learning. 						

5- Many problems will be discussed and solved in the classes and tutorials, which offer working with one or more classmates to exchange ideas and discuss the material.
